

IMPORTANT:

Superstratum Deodor Bombs can quickly create ClO₂ gas. Before activating the first dry sponge, place all Deodor Bomb kits in their correct location throughout the home. Begin activating the Superstratum Deodor Bombs from the furthest point of the home, and work backwards moving towards the exit to reduce exposure as much as possible. Be sure to have enough water available to activate all dry sponges before you begin.

If you experience lightheadedness, or difficulty breathing during or after treatment, seek medical attention immediately.

GAS

1. Put on an N95 mask and nitrile gloves.
2. Remove all contents from the Deodor Bomb's plastic clamshell container, and gently pour warm water into the plastic container to the top of the indicated fill line. Do not overfill the container.
3. Remove the dry sponge from the foil wrapper, and place the dry sponge BLUE side down into the water. The sponge will begin to expand and activate. Do not pour excess water on top of the sponge. Within minutes the sponge will begin to generate a calculated amount of ClO₂ gas.
4. After all Deodor Bombs are activated, exit the home. Close and lock all exterior doors.
5. Allow the gas to circulate through the home for 12 undisturbed hours. You may wait more than 12 hours before returning to the home; however, this will not affect the performance of the Deodor Bombs.

AIR OUT

1. Put on an N95 mask and nitrile gloves, and reenter the home.
2. Close plastic container with liquid and sponge packet inside. The remaining yellow liquid is an oxidizer; therefore, do not spill as bleaching may occur.
3. Dispose of plastic holder and contents in an outdoor refuse container or outdoor composter. The sponge is biodegradable, and the plastic container is #3 plastic and recyclable. The plastic container may be rinsed and reused.
4. Open all doors and windows to allow rooms to air out. Depending on the size of the home, air out may take a few hours. You can reduce the air out time needed by using fans and air purifiers to remove the ClO₂ gas from the home.
5. Turn on the HVAC system, and install a new air filter.
6. Some homes may require up to a few days for the residual ClO₂ odor to completely dissipate.

IMPORTANT:

If you feel nauseous, experience headaches, or feel any sensitivity to the residual ClO₂ odor, exit the home, and continue the air out until the odor has completely dissipated.
